

PIRATE SEA HOP

Pirate crossing instant game

Art direction and production plan

Norair Harutyunyan

Review presentation | September 2026

A pirate crossing with a clear choice

**One more jump.
Or take the treasure.**

Game idea

Cross turquoise water by jumping between floating crates and barrels. Each safe landing creates a new choice: advance or collect the current return.

Intended audience

Adults of legal gambling age who prefer short instant-game sessions. This is a planning hypothesis, not a validated research finding.

Design distinction

A visible route makes progress easy to follow. The rear-view pirate, map and comic sea encounters provide identity without steering or combat.

Visual principles

Decision hierarchy

Read the hero and next target first, then the multiplier and cashout. Scenery supports the crossing.

Materials and depth

Warm sculpted wood, broad bevels, gold trim and consistent water contact. One elevated camera unifies the scene.

Mobile clarity

Keep the pirate silhouette, landing surfaces and control labels clear. Preserve bold white multipliers with dark outlines.

Supplied interface and multiplier lettering

Color role	Application
Turquoise	Water and route field
Warm wood / gold	Platforms and trim
Navy	Stable control panel
Green / yellow	Actions and cashout

Moodboard

01 Stylized character proportions

02 Siren shape language

03 Shark silhouette

04 Coastal light and depth

05 Island forms and staging

06 Warm architecture and depth

07 Wood and metal construction

08 Treasure map language

09 Barrel construction

Nine approved references, in website order. Grayscale study; reference authorship is not claimed.

Character performance

Pirate: the readable route hero

The tricorn, scarf, hook and map retain a clear identity from behind. Front, back and three-quarter views define the approved design.

Siren: the mischievous sea encounter

A distinct face, hair mass and complete tail silhouette separate the siren from the other encounters. Preserve all three full-body views.

Kraken and shark

Kraken: a rounded silhouette

The purple body and broad tentacle shapes establish the encounter. The board shows front, back and three-quarter construction.

Shark: a clear aquatic threat

Preserve the approved fin, tail, mouth and leg-free anatomy. The full-body views support a consistent in-game silhouette.

Environment and composition

Complete route

Starting ship

Floating crate

Floating barrel

One readable route

Keep the hero and next landing target on the centerline. The ship deck anchors the start; the island marks the visual destination.

Shared camera and contact

Use consistent water gaps, surface angles, shadows and foam to ground every floating platform.

Mobile first

Preserve the character and controls before peripheral scenery. Check water seams and protect multipliers over bright foam.

Main game screen: mobile

First safe landing

Route advances

A compact crossing

The pirate and next target lead the portrait composition. Original mobile browser chrome is retained.

A clear decision

The lower panel keeps stake, difficulty, JUMP and CASHOUT together after a confirmed safe landing.

Responsive validation

Check 360, 390 and 430 px widths, long amounts, contrast and browser safe areas during production.

Main game screen: desktop

Primary read

The central route and pirate establish the next landing target.

Stable actions

JUMP and CASHOUT stay grouped in the lower control panel.

Supporting scenery

Side props frame the route without changing the advance-or-collect decision.

Crossing progression: mobile

The first six supplied frames, in the original export order.

01 Ready to bet

02 First jump

03 Safe landing

04 Route advances

05 Barrel landing

06 Next jump

One continuous crossing

The pirate leaves the ship, reaches the crate and advances to barrels. Each confirmed landing returns to the same JUMP or CASHOUT choice.

Crossing progression: desktop

The same six setup and progression moments in the final landscape composition.

01 Ready to bet

02 First jump

03 Safe landing

04 Route advances

05 Barrel landing

06 Next jump

Ready to bet

Stake presets and difficulty selection are visible before the pirate leaves the ship.

MOBILE

DESKTOP

Easy / Medium / Hard / Hardcore. BET begins the round; the artwork is preserved as supplied.

Safe landing: advance or cashout

The pirate reaches the crate and the action pair becomes JUMP and CASHOUT.

MOBILE

DESKTOP

Production rule: update the confirmed multiplier and cashout value together after a successful landing.

Route advances: barrel landing

The route changes from crates to barrels while the next target remains visible.

MOBILE

DESKTOP

The next jump appears in frame 06 of both progression overviews. Landing pivots must remain consistent.

Tentacle encounter

The purple tentacles create a distinct interruption to the crossing.

MOBILE

DESKTOP

Final screen export shown unchanged. The latest combined-layer and Kraken pose references appear on page 19.

Shark encounter

A shark interrupts the route with a recognizable mouth, fin and character reaction.

MOBILE

DESKTOP

The encounter is a visual outcome target. Game results, not animation timing, determine settlement.

Siren encounter

The mermaid encounter supplies a different silhouette and a clear comic character pose.

MOBILE

DESKTOP

Original export state name: Mermaid encounter. The approved full-body Siren board appears on page 05.

Cashout: win confirmation

A stable YOU WIN panel displays the example result over the route.

MOBILE

DESKTOP

The \$246 result is illustrative. Production values and decimal formatting must be reconciled with the game rules.

Motion direction

Supplied pose targets and proposed timing; this is not a completed Spine animation export.

Idle: restrained movement

01 Shark encounter pose

Jump: 550-700 ms

02 Siren encounter pose

Tentacles: one combined layer

03 Kraken encounter pose

Landing

150-250 ms. Brief compression, then return to the decision pose.

Encounters

800-1,100 ms. Distinct poses; the result must remain readable.

Cashout and reset

Cashout: 600-900 ms.
Reset: 300-450 ms.
Reduced motion uses short pose changes.

One crossing, one decision at a time

State requirements for the production UI and animation handoff

Round state	Visible action	Production requirement
Ready	Stake / difficulty / BET	No cashout before a successful landing.
Resolving	Pending or disabled action	Lock repeated input while advance or cashout resolves.
Active	JUMP or CASHOUT	Update multiplier and return together after confirmed success.
Settled / lost	Win receipt or encounter result	Settle cashout once; a loss ends the uncashed round.
Error / reconnect	Inline feedback	Preserve the last confirmed round state.

Server results control settlement; animation does not award money.

Pending, insufficient-funds and reconnection screens remain production work. Supplied artwork contains illustrative values.

Team ownership and workload

Proposed art production from the submitted direction - one team per game

Owner	Task decomposition	Dependency	Person-days
UI Designer	Layouts 2d; kit 2d; states 1.5d; device review 1.5d; handoff 1d.	Direction and phone hierarchy	8
2D Artist	Audit 1d; character layers 3d; environment 2d; encounters 2d; cleanup 2d.	Approved boards and rig feasibility	10
Spine Animator	Rig 2d; idle/jump/landing 2d; encounters 2d; cashout/reset 1d; export support 1d.	First rig-ready pirate by day 5	8
Art Lead	Direction/scope 1d; reviews 1d; risk and handoff 1d.	Agreed scope and visual direction	3
Total	Base effort; specialists work in parallel	20 working days elapsed	29

29 base person-days: 26 specialist days + 3 Art Lead days. Assumes reuse of submitted artwork, one pirate rig and three encounter sequences. Unspent contingency is excluded.

Milestones across 20 working days

Staged handoffs, five review gates and two days of contingency

Window	Main work	Acceptance gate
Days 1-3	Scope and direction	Approve route, phone hierarchy, materials and rig feasibility.
Days 4-8	Assets, UI kit and first jump	First rig-ready pirate by day 5; approve one complete jump by day 8.
Days 9-14	Motion and integration support	Complete three encounters, cashout/reset and exports; review with engineering.
Days 15-18	Device and state review	Check phone/desktop layouts and visual error states; resolve findings.
Days 19-20	Contingency and handoff	Reserve correction capacity; confirm inventory and package completeness.

Assume consolidated feedback within one working day. Re-estimate after the first rig test. The two concepts have separate allocations; one team is not committed to both at once.

Review gates and production handoffs

01 Scope and composition

Confirm the asset inventory, target devices and readable financial controls before full production. Approve one representative asset and the mobile composition.

02 Staged rig handoff

Supply named layers, hidden overlaps and a shared ground pivot. Hand off the pirate by day 5; approve a full jump and landing by day 8 before extending the encounters.

03 Integration dependency

Allocate a frontend engineer separately for runtime integration and state testing. Without that support, the handoff is an integration-ready art package. Art specialists review visual feedback; engineering owns settlement and reconnect.

Engineering implementation, game mathematics, audio, certification and release require separate estimates.

Risks and mitigation

Owners act at the first failed gate; material changes require a revised estimate

Risk	Mitigation	Owner / checkpoint
Water obscures values	Check phone-scale contrast; protect outlines, multipliers and cashout values.	UI + Art Lead / visual gates
Flat assets need more work	Audit overlaps and layer separation; re-estimate after the first rig test.	2D + Animator / first handoff
Landing mismatch	Share pivots and camera direction; approve one complete jump first.	Animator + Engineer / day 8
Payout or state mismatch	Engineering owns settlement/reconnect; UI reviews consistent values and feedback.	UI + Engineer / state review
Scope or feedback delays	Escalate feedback over one working day; protect contingency and re-plan added scope.	Art Lead / daily

Reserve days 19-20 for remaining corrections. Track any contingency effort separately from the base estimate.

Final assets and Figma source

Complete character set

Pirate, Siren, Kraken and Shark boards in the approved order, with full-body front, back and three-quarter views.

20 final game screens

Mobile: 10 final views.

Desktop: 10 corresponding views.

Original export order and artwork preserved.

Figma: final Instant game section

Norair Harutyunyan Test Task - INSTANT GAME

Selected section: 8-10993

[Open final section in Figma](#)

Approved artwork, nine selected references, all final screens and the production plan in one presentation. Editable layers, Spine rigs and runtime errors remain production work.
